

WHY ALLERGY DROPS

— Are An Effective Alternative to Allergy Shots —

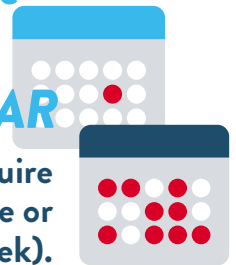

Immunotherapy treatments (allergy shots and allergy drops) alter your immune system over time and help your body create a tolerance to things you are allergic to.

Allergy drops, also known as sublingual immunotherapy, are a way to treat allergies *without injections.*

Drops only require **1 DOCTOR'S VISIT PER YEAR**

(while allergy shots require doctor's visits once or twice per week).

A dose of allergy drops can be administered in less than a minute *in the comfort of your own home!*

( Allergy shot appointments can take up to an hour to complete and must be done at a doctor's office.)

Drops are equally as *effective in reducing symptoms as shots*

according to The Journal of Allergy and Clinical Immunology.

Most patients can stop over-the-counter allergy medication *just three months* after starting allergy drop treatment.
